SCREEN AT A GLANCE

This is the payment-collection screen merchants use 30-50 times a day to take payment from a customer. It is the single most-used screen in the PixelPay merchant app.

USER CONTEXT

Typical user: a 45-55 year old kirana shop owner. Hindi or regional language first speaker. Cheap Android phone (under ₹8,000). Sunlight on the screen. Holding the phone with one hand while ringing up a sale.

SCREEN ELEMENTS

Header (back arrow + title). Amount input (rupees). Customer ID / mobile input. Payment mode chips (UPI / CARD / CASH / NB). Optional TXN REF field. Auto-debit toggle. Disclaimer block. Submit button. Cancel link. Bottom navigation (5 tabs).

FLOW IT BELONGS TO

Home → Collect Payment (this screen) → Confirm OTP → Success / Failure → back to Home.

WHAT MAYA HEARS FROM SUPPORT

"Merchants say they don't know if the payment went through." "Older merchants type the wrong amount." "People keep tapping the wrong chip." "Cancel is too easy to miss." "Sunlight = can't read the screen."

YOUR JOB

Walk this screen as a 50-year-old merchant in sunlight. Find every usability issue. Map each one to a Nielsen heuristic. Then run a separate accessibility pass. Submit the critique. *You are not redesigning the screen — you are diagnosing it.*

Deliverable format: Issue → Violates [heuristic name] → Fix. Then a 4-row accessibility table (contrast / tap target / text size / plain language).
