

Project 7 — Clue Sheet

A/B Test Design — the clues point the way, the answer is your work. No Priya needed.

THE PROBLEM

Your new onboarding flow is live and early numbers look good — but 'looks good' is not evidence. Riya, the data analyst, catches tests run on too few users to prove anything.

WHAT TO PRODUCE

An **A/B test brief** with the statistics done properly. Work each one out from the clues below — fill every blank yourself.

1

Work out the HYPOTHESIS

Clue: Three pieces — the change, the predicted effect, and the reason. Make it specific; a vague hypothesis produces a vague test.

Write it > Hypothesis = Changing _____ will [effect] by _____%, because _____

2

Work out the PRIMARY METRIC

Clue: One metric decides win or lose. Pick it before you see any data, and write down what number counts as a win.

Write it > Primary metric = _____. Win threshold = _____

3

Work out the SAMPLE SIZE

Clue: This is a power calculation — it depends on your baseline and the lift you want to detect. Smaller effects need far more users. PixelPay's current week-1 retention baseline is 35%.

Write it > Users per arm = _____ (to detect a _____% lift on a 35% baseline)

4

Work out DURATION + READING

Clue: Fix the duration up front — at least two weeks. Decide in advance how you will read the result. Never stop early because it looks good.

Write it > Duration = _____ weeks. I will NOT peek and stop early.

The clues give you the method; the judgement is your work. That is the whole skill of Project 7.
