

Project 9 — Clue Sheet

Growth & Pricing — the clues point the way, the answer is your work. No Priya needed.

THE PROBLEM

PixelPay has hundreds of thousands of free merchants — but free does not pay salaries. You must design a paid tier, PixelPay Pro. Anjali, the CFO, will pressure-test the unit economics.

WHAT TO PRODUCE

A **growth-and-pricing proposal** — the Pro feature set, the price, and the unit economics that justify it. Work each one out from the clues below — fill every blank yourself.

1

Work out the PACKAGING

Clue: Decide what Pro is before deciding what it costs. The free tier keeps activation and habit features. Pro holds what a serious merchant will pay for — advanced reports, multi-user, priority support.

Write it > Free tier = _____. Pro tier = _____

2

Work out the PRICE

Clue: Do not invent a number. Anchor it — look at Khatabook and similar Indian merchant apps. Sit in a range a small merchant calls fair.

Write it > Price = _____ (anchored on _____)

3

Work out the LTV / CAC

Clue: CAC — the cost to win one paying customer. LTV — the total profit one customer brings before they churn. Estimate both, show your assumptions. A healthy ratio is roughly three to one.

Write it > CAC = _____. LTV = _____. Ratio = _____

4

Work out the PROPOSAL

Clue: If the ratio fails, do not guess a higher price — strengthen the Pro tier or lower the acquisition cost.

Write it > Proposal = the Pro feature set + price with anchor + LTV/CAC math with assumptions shown.

The clues give you the method; the judgement is your work. That is the whole skill of Project 9.
